Legend:

	Part 375 Standard
	TAGM 4046 Guidance Value
	Contaminant Limits for BUD No. 903-2-31 for Parameters not addressed in 6 NYCRR Part 375 or DER TAGM 4046
	Unrestricted Use SCO where no ecological value is indicated

Qualifiers:

U - The compound was not detected at the indicated concentration.
J - Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero. The concentration given is an approximate value.

Organics:

B - The analyte was found in the laboratory blank as well as the sample. This indicates possible laboratory contamination of the environmental sample.

Metals:

B - Reported value is less than the Reporting Limit but greater than the Instrument Detection Limit.

Notes:

Sample collection rate: 1 sample for every 1,000 cy of PDM

MDL (Method Detection Limit) - the lowest limit that the instrument can detect. It is determined on samples which have gone through the entire sample preparation scheme prior to analysis. Measurements above the MDL indicate whether or not an analyte is present or absent in the sample. then

The Reporting Limit (value provided in table) is normally 3 to 10 times the **MDL** and is considered the lowest concentration that can be accurately measured, as opposed to just detected by the analytical method.

Acetone: Detected above BUD Standard. Acetone is one of the most common lab contaminants and the very low detected values may not be the true soil concentrations. Based on the known chemical and physical properties of acetone it is not expected to be present in this material, especially in context of the entire organic parameter results for these samples.
